

Schubox's Simple Paint is a success

Improvement in surface coating performance and quality has traditionally concentrated on application and drying. Schubert's range of spray shop equipment, particularly the Schubox, is a perfect example.

Until the ATE Simple Paint arrived, no-one had considered treating the air before the spray gun. This ensures no contaminant in the air to spoil the sprayed surface, and because it de-ionises the air, lower air pressure is used which dramatically reduces overspray. The unit is a simple retro-fit to any existing spray set-up, water or solvent based.

Up to a 20% saving, sometimes more, of paint and lacquer can be achieved. Contamination of the work-piece and environment is virtually eliminated. Some major users in the UK have reported very significant improvements to their finishing process.

For example, James Taylor of Taylor Made Joinery in Ipswich, comments: "The Simple Paint sounded too good to be true – but when Schuberts offered it to us on sale or return, we just had to try it. The improvement in finish quality and lacquer saving

was obvious from day one."

Ian Sibley of Concept Trade Finishes says of his experience: "I just had to try one and I'm glad I did. It's fantastic. I'm moving into a new factory soon and will certainly have another one."

Hands of High Wycombe, a high quality boardroom furniture maker had one of the first in the country fitted into its Schubox finishing shop. Production manager Wayne Dunford was amazed at the amount of oil and solids the Simple Paint removed from the air supply, which would have otherwise gone onto the sprayed product. He says: "This really is a major breakthrough in spray shop technology."
